Interactive Web Authoring

Learning Outcome: To be able to correctly use JavaScript variables and operators.

You are going to investigate the usage of JavaScript variables to further improve your understanding of the core concepts of JavaScript.

Create a simple webpage and complete the following tasks:

1. Create a variable called Z, assign X + Y to it, and display the result in a console log statement.

2. Use the correct assignment operator which will result in Z being 15 in a console log statement:
   X = 10
   Y = 5

3. Use the correct assignment operator which will result in Z being 50 in a console log statement:
   X = 10
   Y = 5

4. Use a console log statement to show the reminder of the following calculation:
   X = 15 / 9

5. Modify the code below so that every time a user clicks the button 1 is added to the answer variable shown in the console log:

```html
<!DOCTYPE html>
<html>
<head>
    <script type="text/javascript">
        function addFunction() {
            var answer;
            //insert code here

            console.log(answer)
        }

    </script>
</head>
<body>
    <input type="button" id="button" value="click" onclick="addFunction()">
</body>
</html>
```

6. Study the code below, there are 8 errors in this code. Correct the errors and test your code in a browser to validate.

```
<!DOCTYPE html>
<html>
<head>
        <script type="text/javascript">
                function practicalFunction() {
                        var first Name = Joe;
                        var surname = "Bloggs';
                        var age = "28";
                        var t = age + "1";
                        console.log("My first name is " + firstName)
                        console.log("My surname is " + surname);
                        console.log("My age is " + age);
                        console.log("Next year my age will be " + t)
                }

        </script>
</head>
<body on load="practicalFunction()">
</body>
</html>
```
